- 16 Rye, Winchelsey, Gorend, Thames, Fair Isle Rhodes. S. by east.
N. by west.

A declaration of the use of the two preceding Tables, very profitable and easie to the meanest capacitee.

IF at any time you would know when it will be full sea in any the aforesaid Havens or places, and what moone makes a full sea there; you must first learn how old the moon is, which you shall finde in the 5. columnne of the Almanack, over against the day of the moneth for this yeare. This age of the moon if you seek in the head of the second table (intituled, The residue of the tide table in houres and minutes) guiding your eye downwards till you come in the common angle, over against that figure which directs you to the rest of the places in the first table: under that age of the moon, shall you finde houres and min. which is the time of full sea that day in the Haven desired.

Example.

I Would know at what time it will be full sea at *Quinborough* (which is alwayes when the moon is South & North, that is once in 12 houres) the first day of *Ianuary* this yeare. Over against the said first day of *Ianuary* I seeke in the 5. columnne of the Almanack, and I finde the figures 15, which sheweth that the moon is 15 dayes old: This 15 I looke in the head of the table, intituled The age of the moon, which I finde joyn'd with 30, which is the moons age decreasing, as the other columnne is her increase till she be 15 dayes old; And the difference of 15 dayes produceth a like time of full sea. Now guiding mine eye in that columnne downeward, I finde these figures 12 houres, 0 minutes, which is as much as to say, it is full sea at *Quinborough* the first of *Ianuary* at 12 a clocke at noone and midnight; and the moon North and South: And so it is at *Southampton*, *Portsmouth*, *Ile of Wight*, &c. Doe thus with any other place and it is very easie.

Yet you must observe that it floweth one point of the Compass more in the spring-tides, that is, at the full & new moon, then it doth in the neap-tides, that is, at the quarters of the moone, especially if it be a river where there is any indraught, and that is of good distance from the sea; yea when there is neither rage of windes, nor other cause to produce or hinder the
said

said effect: As for example, It floweth at *London Bridge* at the full or change of the moon when she is South west or North-east: But in the quarters of the moon it scarcely floweth there, when the moone is South-west and by South, or North-east & by North: And this is generally true for ever. So likewise the latitude of the moon raiseth or hindreth the tydes, for if she have North latitude she will rise sooner, and bring in the tydes earlier then when she hath South latitude: so also if she have a fit aspect to *Venus* in moist signes, it will wonderfully increase the tydes; but if to *Mars*, it will lessen the tydes. Some other causes there be which for brevitie I omit: And for more ease I have calculated in the dexter columnne of the blank page over against every day in the yeare, the time of full sea for the two grand stages of this Isle, *Gravesend* and *London*.

Benedicite Maria & Flumina Domino.

The contents of the severall columnes in the following Kalender.

The first is the dayes of the Moneth.

The second is the dayes of the weeke, *A* being the Dominicall or Sunday letter.

The third is Saints dayes.

The fourth is the signe and degree the Moone is in at noone.

The fifth is the age of the Moone.

The sixt is the houre and minute of Sun-rising at *London*, which if you double you have the length of the night, but if you subtract it from 12 you shall have the Sun-setting, which if you double you have the length of the day: As for example, The Sun riseth the 2d of *January* at 8 a clocke, which doubled is 16 houres the length of the night: but if you take the Sun-rise from 12 there will rest 4, which is the time of Sun-set: this 4 doubled is 8 houres the length of the day. Thus doe with any other day.

The seaventh is the Aspects aswell of the Moone to the Planets, as of the Planets amongst themselves, which in this my Almanacke doth vary from any heretofore: And is thus to be understood that for brevities sake the character of ☾ is left out when she is in aspect with any Planet. As for example, the 7 of *January* I finde ☐ ♄ 6. a. which sheweth that the Moone is in a Quartile Aspect with *Saturne* at 6 a clock in the morning. So likewise the same day I finde ☿ ♄ 9. p. A conjunction of *Saturne* and *Mercury* at 9 a clock at night, with a probable conjecture of the weather. And so of the rest.

January hath xxxj dayes.

- ☾ Last quarter the 7 day, 4 minutes past midnight
 ☾ New moon the 16 day, 37 minutes past 4 in the morning
 ☾ First quarter the 23 day, 6 minutes past 2 after noone
 ☾ Full moone the 30 day, 38 minutes past 7 in the morning.

What! a Titan scarcely mounted in his chair,
But Phœton *è* confronts his being there?
Cyllenius *è* helps his master, Mars in square
To Saturne; these will much disturb the aire,
And alterations cause iⁿ the Microcosme,
As likewise wonders in the Microcosme.

Why doth it raine so oft, I pray thee tell?
 And why from heaven such stormes with showers of haile?
 'Cause for our finnes wee (mortalls) doe not mourne,
 The heavens themselves for us, to teares doe turne.
 Bleed, and take Physicke therefore .to prevent
 Thy bodies sicknelle ; but thy soule's, repent.

The Sun and Mars with Jupiter are squaring:
 Just at the Solstice, Mercury doth oppose
 Saturne: while Sol and Mars in Cancer close:
 And Mars with Venus are a match preparing
 At Midsommer; joyn'd forces show their strength:
 The cause precedes, the effect succeeds at length.

Sol marries Venus: Mars with Mercury
 In Cancer make a league: their jollity
 Soone turnes to discontent, and frowning lookes,
 With teares on all sides: For Sterculius brookes
 No private meetings: Jove, Dame Natures friend
 Steps in, takes up the matter in the end.

Who dare stand in an incens'd Lyons path?
Hermes beware: heere comes the God of wrath;
And threat's some mischiefe, full of rage and cruell.
Adding (Canicula present) fire to fuell:
And Mercury blowes it, but the wood is wet,
And quite extinguish't ere the Dog-dayes set.

A horrid Tempest! rage of windes burst forth
 Out of all corners: But the boystrous North
 Beat's downe the rest; and beareth sway alone:
 So Δ Jove with Hermes say; Δ joyn'd to the Sun
 In Libra: neare the Δ Equinox and Δ Michaelmas
 Will these effects (with others) come to passe.

Cynthus with retrograde Mercurius met
 In the chill Chelæ, raiseth windes and wet.
 As fire with water, Aire with earth agree :
 Twixt crooked age and youth like sympathy.
 Mars frownes at Venus, but the love she beares
 To withered Saturn's faind, though full of teares.

Diffusa nihil moror, à vero cùm fortè recedunt.*

Of the foure parts or Quarters of the yeare.

Of Winter.

Winter is the first Astronomical quarter of the yeare, and tooke beginning (according to ancient custome of the Church) in the moneth of December, in which Christ was borne, & that time of the moneth in which the Sun entered the first scruple of (the cold, earthy and dry signe) Capricorne, which was likewise supposed to be the day of Christs Nativity, and then the shortest day of the yeare, and it was then on the 25 day: But the Suns entrance into Ψ is not now on the 25 day, by reason of the anticipation of the Equinoxes and Solstices, going back in every 134 yeares (or very nere) much about one whole day; so that the Suns entrance into Ψ was the last yeare 1636 upon Sunday the 11 of December, 25 min. past 4 of the clock in the morning in this our Horizon somewhat more then 13 dayes gone back, and so much difference betwene our obseruation Politicall and Astronomical of Christs Nativity, which in proesse of yeares would fall in Sommer; if our account remaine uncorrected, notwithstanding the Reformation used beyond-seas: for neither the accounts of which I have heretofore spoken are true. For the Reformed account (although exactly) was but calculated from the Nicene Councell, which was in An. Christi 328, to the yeare 1582, whose Radix should have been at Christs Nativity. But this hath been already mentioned.

Touching the Astronomical position of the heavens, the aforesaid Sunday the 11 of December, It is to be observed that the Sun at his ingresse into Ψ is very neare the \square of Υ in ∞ , which will cause serenity, and a temperature of aire, with open weather and windy; so likewise the Δ is newly separated from a Δ of δ in ∞ , and will produce a certaine kinde of coldness, which shortly will dissolve the coldnes of the aire into sleet and raine, by reason of the signe \cap in the ascendent; & likewise in the \ast of η , which will manifest it selfe on the 14 and 21 dayes of December, for on that the Δ comes to the Ascendent,

A Prognostication.

and on this the joynes with J Lord thereof, who is in \square to Q causing *Aperio Portarum* to snow and raine. Now the temperature of this winter rather tends to moisture and coldnes, then to be cold and dry: And yet O \odot h about Christmas (and so to the moneths end) as in my last yeares Almanack will be (very profitably) frosty, snowy & sharpe aire, with some blustering and stormy winds. Other matters might be spoken of, not onely Meteorologicall, but also some contingents upon all subliaries, which the Ancients have obserbed out of the various configurations and positions of the stars; which the Reader shall finde in their proper place over against the Day of the moneth; the effects of which he shall glance at, in the end of this as in my last yeares Prognostication: and therefore I forbear my collections, leauing every man to be his owne Interpreter. The dayes are now at the shortest, being but 7 houres & 34 minutes long, (the space of time the Sun shineth in our Horizon at London) for rising at 13 minutes past 8 in the morning, and setting 43 min. past 3 afternoon; he continueth under the earth, or maketh with us the longest night (by reason of the absence) 16 hour. 26 min. This quarter continues the Suns progresse through v , vi , and x .

Benedicite	{	Rores & pruina Gelu & frigus Glacies & nives	}	Domino: Laudate & superexalta- te eum in secula.
------------	---	--	---	---

Of the Spring.

Which beginneth on Friday the 10 of March, 40 min. past 4 of the clocke in the morning, equalling the Day & night through the world; and the \odot now meeting with Q in the J of v they in the Ascendent and he in the 7 house will (undoubtedly) raise furious and blustering winds, and O h D in \square to J and Q in the Ascendent, will cause a mixt cold raine, & haile sometimes: Yet the J \odot v will purge and cleare the aire by great windes, (and perhaps thunder) which being cleared, the Sun by his beames will cherish and comfort all creatures; And by this mixture of Sol and Ioviall rayes: *Effectus benevolos tam in magno, quam in Microcosmo proferre solet. In Macrocosmo dico, nam in co corpora dulcescunt, aer mitescit, nives dissolvuntur, scaturiunt fontes, Arbores suis frondibus viridibus gaudent; Animalia parturi-*

my. In Microcosmo, humores naturales, & præcipue sanguinem auget & renovat; illumque per universa corporis sui membra diffundit, & dispensat; & ob istam rationem Temperamentum in eo æquale gignit. And as Hippocrates saith, Ver est omnium temporum saluberrimum; and will not this yeare vary (much) from a temperate hot and moist constitution, thereto most naturall and proper. Et tamen hoc certum est, & experientia comprobatur, quod Ventii subitanei, & fortuito contingentes, operationes nonnunquam producant in aëre aperto quæ statim anni temporibus omnimodâ qualitate opponuntur: Atque istiusmodi venti contra Solis constituta, à quodam Planeta violento in cælo prædominante procreari observantur. Yea in some yeares in the hottest dayes of Summer, raine mixt with haille in abundance is generated by reason of the Dominion of h; so likewise many times thunder and lightning (by reason of the power of J) happeneth in the midst of winter: both which, within these few yeares we have knowne to come to passe in diverse parts of this Kingdome to our terror and amazement. Et compertum quoque est quod quælibet stellarum erraticarum, imo vero & fixarum, Vis atque virtus, aut Conjunctione Radiorum, aut Oppositione, aut Trino, Quadrili, aut Sextili aspectu, ad influentias diversas in inferiora effundendas sit aptior et proclivior; Uti ☉ coiens cum Saturno, tristes, melancholicos, & gravioros producit effectus, tam in elementis supernis, quàm in ipsa terra: And so of the rest of the Aspects of the Planets must be judg'd. The most forcible whereof are noted against every day of the moneth for this yeare; and so much for this quartor, which continueth till the Sun's course be through Aries, Taurus, and Gemini.

Benedicite	{	Omnis imber & Ros	{	Domino: Laudate et superexaltate eum in secula.
		Noctes & Dies		
		Lux & Tenebræ		
		Universa germinantia in terra		

Of the Summer.

The Summer takes beginning this yeare on Sunday the 11 of June, 38 min. past 8 a clock in the morning, when Sol cœlestium Princeps et Planetarum, fixarumq; Choragus enters the signe of ♋, where he meets likewise with ♄ scarce a degree distant from

A Prognostication.

from him. The Ascendent is irradiated with the hot and dry
 signe Leo, Et perstringit horizontem corpus stellæ Regalis, viz. cor-
 dis Leonis vel Basilici: which will no doubt bring very hot wea-
 ther with thunder and lightning, and many fiery meteors in the
 aire, especially for that the ☉ Lord of the Horoscope is in corpo-
 rall & with the impetuous star ♄ in ☊, causing likewise there-
 with some violent showers of rain: but the ☿ h ♀ incident, co-
 operating, will mixe haile in divers places, with cold cloudy &
 darke weather, disagreeing with the season: Notwithstanding
 the ♃ with ♀ in ♀ in the mid-heaven meeting with the ☊ of ♃
 will mightily mitigate the precedent influences in and neare
 this our Horizon, rather producing a gratefull and acceptable
 temperature, bringing therewith fertility and abundance of all
 things: Et quamvis hæc commoda hominibus afferunt istæ stellæ
 Planetæve, (Tres Gratix) ♃ ☉ ♀ ex sua natura benigna tamén per
 accidens, hoc est, malevolo malevolorum in cælo prædominantium
 aspectu malè afficiuntur; Et morbidos malevolosque quandoque ob-
 servantur pro lucere effectus: which, who that lists to make tryall
 of, may experiment from the severall configurations heretofore
 mentioned. The Sun is now nearest to our Zenith and in his
 greatest altitude, causing the day to equall the longest winter
 nights; and in these Northerne Climates producing the day to
 such a length, as that in this our Meridian it is 16 hour. 26 min.
 between ☉ rise and ☉ set; At Rome it is but 15 houres, at Pa-
 ris 16. At Yorke 17. At Edinborough almost 18. At Thule Isles 19.
 In the middle of Greenland 22 houres long. And so the further
 North the longer dayes; to some a moneth, 2, 3, and 4 mo-
 neths long, that under the North Pole they have but one day and
 night in the whole yeare; that is to say, a day halfe a yeare
 long, and a night halfe a yeare long: And this quarter lasteth
 the Suns journey through ☊, ♋ and ♌.

Benedicite	{	Ignis & æstus Frigus & æstas Fulgura & nubes	}	Domino: Laudate & Superexal- tate eum in secula.
------------	---	--	---	---

Of the Harvest or Autumne.

Which initiateth when the Sun toucheth the first minute of
 Libra, ballancing the night againe with the day; and this
 yeare is on Tuesday the 12 of September, 17 min. past 11 in the
 night,

night, when the Sun with ♄, ♀ and ♀ are in the Septentrional Angle in an aereall signe in □ to Saturne, in ♀ in the West quarter, opposing the 18 grade of the ascending signe ♄. The ♀ likewise in m unfortunate in △ thereto, and the mid-heaven will certainly produce exceeding turbulent & blustering windes, with cold raines, foggy mists, and not very pleasing to these parts: For since the significators are angular & strong in their places, it is probable their influences will not be partile, (for opposition of equall powers seldome produceth difference in harmes,) but spread themselves throughout our whole Horizon: The particular aspects are meteorologiz'd in their proper places.

Quamdiu erit Terra: Sementis & Messis, Frigūque & ætus & Æstas et Hyems, Diēsque et nox non cessabunt: *Gen. 8. v. ult.* Benedicite omnia opera Domini Domino: laudate et superexaltate eum in secula, &c.

Of Eclipses.

These times shall the bright Lamps of Heaven be deprived of light this yeare: Twice shall the Inhabitants of the earth lose the light of the Sun by interposition of the opacous body of the Moon betwene their sight and him; And once shall the Moon be deprived of her borrowed light by the direct interposition of the earth between the Sun and her; but neither we the Inhabitants of Great Brittain, nor any residing in Christendome shall observe any these defects in either the Luminaries.

But in Asia throughout even to the Eastern Ocean, in Cam-paa, Camboia, Malacca, and region of Malabar, in the Isles of Ceilan, Sumatra, both the Javas, Borneo, Celebes, the Moluccoes, and Phillippines, De Las Velas, and other lying in the sea Lantchidol, and neare the Lucaeh, Beach, and Maletur Kingdoms: upon the Southerne continent shall be a great eclipse of the Sunne upon the 26 of January new stile, 16 old stile, in 7 grade \approx , in their very noone-sted, or South angle, for this Conjunction is removed from our Horizon towards the East and South (which the Portingals and Hollanders frequent Navigators to Java Major, may observe) 6 houres 22 min. before our noon: It will be terrible to them, appearing of an obscure black colour, 12 parts of the Suns body (being in the whole 12) darkned, and will continue from the beginning to the end, 4 houres & almost a quarter.

A Prognostication.

Of the second Eclipse of the Sun.

Which will happen on the 11 old stile, but the 21 of July new stile, at our 6 of the clocke in the evening; but is not to us eclipsed by reason of the Moones Southerne latitude and parallel: But to those people living in the longitude 287 or thereabouts removed westward from us about 7 houres, (And in the West parts of America, especially those neare the Equator, as New Spaine, Jucaran, Fonduras, Nico, The Island of Popinages, The adjacent Islands of Cocos and Los Galopagos, with golden regions about Peruvia) shall be conspicuous a most fearful eclipse of the Sun in the last degree of Cancer totally darkened of a darke yellowish colour: And by reason of the many configurations of the planets, and the most malevolent opposition of Saturne & Mars incident, it will be a fore-runner to them of some unexpected calamity and misery: (But our English proverb saith, It is an ill winde that bloweth no man good.) It will be 3 houres long before the Moon have left the Sun, but being not seene of us, I forbear to mention it any further.

Of the last Eclipse.

Which is of the Moone, happening with us the 21 day of December, but with those of the Reformed the last day of the yeare 1637. 36 min. past our 11 a clock before noone; and therefore our Antipodes & Pericæans shall behold it: For our mid-day is their midnight, and their Sun-rise is our Sun-set, &c. The Moon to them will be darkened 11 parts of her body (being 12) in the 10 degree of Cancer, approaching next to the hatefull opposition of h, and the planet of 4 ♀ will be of great force amongst them: But since, Nihil nocent Eclipses illis Regionibus in quibus non videntur, I have no more to say. Then

If God on others frowne, but on us smile,
Wher's our obedient thankfulnessse meane while?
Shall we runne headlong in a blinde pretence,
And sinning tempt th' Almightyes patience?
No: if we doe, we may our selves assure,
No mortall can his wrath at last endure?
'Tis very true, more great Eclipses bee
To our Antipodes, which we cannot see:
Whence they are subject to some worser feares

Then is to us portended by the spheares.
But what of that, wee know th' Almighty's power
Is tied to no meanes, but can afflict each houre.

Of the natures, properties and effects of the 7 Planets.

Of Saturne ♄.

The Planets differ from the fixed stars, and may be knowne from them thus. First the fixed stars are higher then the planets, which the corporall conjunction of the planets with the fixed stars doth plainly manifest, for the planet is under the fixed star, and doth hide it, by interposing betwixt it and our sight: And amongst the fixed stars there are some of the 1 magnitude in the Zodiacue, with whom the planets may toyne corporally by reason of their small latitude from thence; such be the Bulls-eye in 5 degree of ♊: The Lyons heart in 29 degrees of ♎, Spica virginis in 19 degrees of ♍, the Scorpions heart in 5 degrees of ♏, with some others of lesse magnitude neare the Zodiacue, that any the planets being in conjunction with, may bee easily knowne; and they fixed stars are not so called, as if they were immoveable: Et certo aliquo cœli loco affixæ; but they are so called fixed, for that they keepe alwayes one and the same latitude and position one towards another, (although they alter their declination) And they move not to be perceived a degree in longitude in lesse time then neare 100 yeares. And againe the fixed stars by reason of their great distance from us in respect of the planets) doe alwayes twinkle, some more, some lesse; but the planets never (or seldome) twinkle. Now that Saturne may be knowne, it is to be obserbed that he is Superiorem altissimus, and is of a pale leaden and swarthy colour, and may be seen before ☉ rising from the beginning of the yeare till the 5 of July, at which time he is in opposition to the ☉, and becomes occidantall, appearing after ☉ set, and walketh in ♊ (one of his houses) all this yeare: his other house is ♏, his exaltation ♈, his detriments being in ♉ and ♎, and he falleth in ♋. He is retrograde from S. Markes day untill Holy-roode day: And the 14 of January at 7 at night, the 11 of February at 8 in the morn. March 10 at 9 at night, Aprill 7 at 9 in the moone, May 4 at 6 at night, and the 31 day at 11 at night, June 27 at midnight, on

A Prognostication.

S. James Day at 1 in the mozne, August 21 at 5 in the mozne, September 17 at noone, October 14 at 11 in the night, November the 11 at noone, and December the 8 at midnight, you shall observe the Moon to be in coniunction with Saturne a little under him; but the 8 of January in the next yeare the Sun and Saturne are in coniunction, and Saturne not to be seene of a good while after, and that in the morning: So likewise the 7 of Ianuary this yeare at 9 at night Saturne is with Mercury. The 6 of February at 3 afternoone Saturne and Venus are in coniunction, so are they againe on the 28 of Novemb. at noone, by which meanes it is easie to know Saturne. He is 30 yeares in compassing the Zodiacque, according to the verse, Annis triginta Saturnus conficit orbem. Complexionem dirigit frigidam & siccam, (Melancholicam) ideo rigentis et gelidæ naturæ dicitur, Et Saturnus appellatur à Saturitate, vel quod annis saturetur: He is an enemy to humane nature, and the greater infortune; and if he be well seated, he is amongst the planets as a grave Counsellour is in a Kingdome, otherwise a Rebel. His aspect, but especially his with ♄ in the Spring & Harvest brings raine and windes, in Summer haile and thunder, which ♄ in Spring and Summer, rain haile and thunder: In Harvest and winter cold rain or snow. With the ☉ he causeth Apertio Portarum, or when the ☽ departs from the ☉ to him, or from him to the ☉ by any beames, there is great alteration of weather: For in the Spring & Harvest he causeth cold raine, haile or snow: In Summer thunder, haile, raine, and darke weather: In winter snow and hard frosty weather, and this aspect Est magnum argumentum veritatis et certitudinis Astrologiæ.

Saturne with Venus causeth cold suddaine showers in winter snow or rain: Saturne with Mercury a tempest, very windy and moist; in winter rain and snow: Et miram addit frigoris acrimoniā. Saturne with Luna in Spring and Summer cloudes, darke, and moisture; in Harvest hoarie frost, and cold aile; in winter cold rain or snow, and sometimes frost: And when he rules, the East winde commonly bloweth. Furthermore, Saturnus significat Limidam prolem, Judæos, Mauros, Monachos, Descriptos, Rusticos, Coriarios, Sutores, Figulos, Vespillones, Cloacarios, &c. Et si sit bene dispositus habet significationem de Edificis, ducendis

incendendis aquis, hæreditatibus, & laboribus. Sed si fuerit cadens et infelix, de morte, luctu, miseria, desperatione & carcere. At si fuerit potens & male dispositus, de consiliis malis, calumniis & oppressione miserorum.

Mortales odio Infestans & peste maligna

Falcifer immittit devorat ora senex,

Ora modis miris, semper cum lucida pallens,

Invida hunc cordi est, ambitioque latens.

Of ♃ Jupiter.

Jupiter (so called, quasi Juvans Pater) superiorum medius, he is sanguine, hot, and moist, natures friend, and the greater forger: and as a good Governour is in a Kingdome, so is he amongst the planets. He is 12 yeares in going his circuit, as the verse hath it, Signiferum absoluit duodenis Jupiter Annis. He is termed the father of cleares, producer of wholesome gales, and causeth faire weather: he is of a bright fulgent aspect, and you may obserue him to rise in the beginning of January this yeare about 11 in the night, the Sun more and more departing from him untill the Spring Equinox, at which time they are in their greatest distance: the ☉ setting at 6 and ♃ rising. And ♃ is taken for the Evening star, appearing very glorious, and continueth till Michaelmas, at which time the ☉ deprieth us of seeing him, being in ☌ together: And so for the rest of the yeare he is counted the Morning starre, he wanders in the first face of ☌ the beginning of the yeare: is retrograde till the 12 of May, where in the last Decade of the Virgin he becomes Direct and so proceeds, meeting with ♃ the 6 of January at 3 in the moone, on Candlemas day at 6 afternoone, and S. Davids day at 6 at night, both rising soone after ☉ set, so also the 28 day at 6 at night, Aprill 24 at 7 at night, May 11 at midnight, Iune 18 at 6 at night, Iuly 16 at 3 in the moone, August 12 at 10 at night, and September 9 at 5 afternoone, shall you obserue ♃ with the Moone, but the 29 day the ☉ is with him, and so not to be seene untill the 4 of Novemb. about 4 in the morning the ♃ meets him, rising together 3 houres before ☉: so Decemb. the 1 at 8 at night, and the 29 day at 10 in the morning the ♃ is with him againe. Also the 6 of September you shall behold a pleasant ☌ of ♀ and ♃, a little above her in the West soone after ☉ set, but quickly gone

A Prognostication.

gone by reason of their propinquity to the ☉: so the 14 of Septe-
 24 and ♀ jussle together about noone with furious swordes, &c.
 Apertio Portarum in Ventos: And the 20 of December is a great
 coniunction of ♀ & ♂ in the first degree of m, ♀ a little higher,
 having 25 minutes more North latitude ascending: And thus
 much for his coniunctions this yeare, by which meanes he may
 be knowne. His aspect, but especially ♂ with ♀ in Spring &
 Harbest, causeth heat, rain, thunder and lightnings: In Sum-
 mer thunder and lightning, with excessive heat: In Winter (as
 in this yeare) he causeth snow, and darke cloudy weather, and
 great windes. With the Sun he driveth away raine by great
 windes in the Spring and Harbest: In Summer hee often
 brings thunder and lightning, sometimes he causeth haile, but
 most part faire weather in all quarters of the yeare. With ♀ in
 moist signes he brings milde rain & wholesome showes, but in
 other signes he brings faire and pleasant weather: With ♀ it
 is Apertio Portarum, ingendring most vehement and blustering
 windes, which may be obserbed in the Almanack: for as often
 as the ☽ goeth from ♀ to ♀, or ♀ to ♀ by aspect or ☽, the ef-
 fect succedes in blustering weather, &c. With the ☽ he brings
 faire weather and white dispersed clouds: He in his dominion
 causeth the North windes to blow: His houses are ♀ and X:
 His exaltation ♄: His detriments be II and III, and his fall
 is VII.

Vilius affulget lucundo Sydere terris

Iupiter, unde Iuvans dicitur esse pater.

Iura Magistratus, Fora, Tempia, tuerur & Vrbes:

Iustitiâ clarum, consiliisque riget.

Sub ♀ roscaprosapia, Principes ecclesiastici, Episcopi, Sacerdotes,
 Iudices, Senatores, Officiales, Consilarii, Iuris-consulti, &c. Si bene
 dispositus, de honoribus, divitiis et magistratu cogitat. Si cadens de
 Luxu, misericordia, Patientia, Et perferendis incommodis. Si potens
 & malè dispositus, de ambitu, pompa, et prodigalitate.

Of ♂ Mars.

MArs superiorum infimus (quasi Mayors dicitur,) quia Maribus
 bello præsidet. He is intemperately choleric, hot and
 of nature, malevolent, the lesser infortune, 2 yeares in gold
 his Zodiacall circle, as the verse mentions, Mens quater felix

the circuit *Astra Gradius*. It well placed he is amongst the planets as a good Captaine is amongst Souldiers, but if ill, he plays the Tyrant: His houses by \vee and \wedge , his exaltation γ , his detriments δ and π , his fall σ ; he is of a fiery red colour: he is occidentall from the beginning of the yeare till the 16 of June, when the \odot meets with him, causing him to be orientall till the yeare after: He is not retrograde at any time this yeare, and the 19 of January at 2 afternoone, Feb. 17 at noone, March 18 at 7 in the moone, Aprill 16 at 2 in the moone, May 14 at 8 at night he and the Moone meet together: and the 21 day at noone he is with ζ , June 12 at 2 afternoone he is with the Moone, but not to be seene, because the 16 day the \odot and he are in δ in π : and he is then made orientall. The 25 day of June ζ and he are conjunction, (causing *Apertio Portarum* in *pluvias et tonitruum fulguribus*) at 4 in the morning opposing the ν , and he is forc't to seeke her lodging with Saturne the 27 day at midnight: The 11 of Iuly the ν with δ oppose η , and the next day is a terrible opposition of η and δ : the 16 day δ ζ γ at 5 afternoone, August 8 at 8 afternoone the ν is with δ and γ : The 6 of September δ and the ν meet at 1 a clocke afternoone, which day after \odot set Venus and Iupiter are to be seene close together: 20 minutes above γ in the West angle. The 5 of October at 2 in the moone δ is with the ν , and the same night γ with ζ are together after \odot set. On All-sainis day at 3 afternoone ν meets δ in the beginning of π . December the 1 the ν having bene with δ at 4 in the morning, carries a message to γ , and overtakes him about 8 at night: And the 20 day about 2 afternoone δ makes a treacherous league with γ : The 29 day the ν makes peace with betweene γ and δ , and δ intercedes by a trine aspect.

The Aspects of δ , but his Coniunction especially with the \odot causeth dry windees or drought in watry signes in Summer, (as this Summer about the midst of Iune) he causeth thunder and rain. In winter great windees rain and snow. With ζ , *Apertio Portarum*. In Spring and Autumne rain, in Summer (as about Midsummer this yeare) showes, with thunder and lightning: In winter cold and snow, with γ in windy signes (as this yeare about 13, 14, & 21 of May) great windees,

A Prognostication.

and perhaps thunder and lightning. In hot and dry signes as in Leo about the 8 and 9 of August heat and drought, but generally his aspect of \odot with ζ , brings fierce suddaine and impetuous winds mixt with other weather, &c. Mars with the Moon causeth notable change of sweather as the season requires: For in Summer he brings heat intemperate, thunder, lightning, conflagrations and fiery impressions. In watry signes raine and diuers coloured cloudes, & he ruling, the West winde bloweth.

*Marte dolus, prada, cades, violentia regnant,
Proditio Bellum, miscetur sacra Prophanis.*

Et sub marte, Ruffa propago, omnis generis milites, belli ductores, satellites, medici, chirurgi, Alchymistæ, Bombardarii, Laniones, Liatores, Carnifices, Latrones. Opificia ignis, Artes fabriles, &c. Si bene sit dispositus, de itinere, fabrica, et militari dignitate. Si sit infelix, de furtis, ludo, superum contemptu, et ferendis discordiis: Sed si potens et male locatus, de cæde, incendio, rapinis et vindicta cogitat.

Of the Sun \odot .

SOL (planetarum & Fixarum Choragus) quasi solus lucens, For all other lights become darke at his approach: He is Oculus & Anima mundi, And as in the body of man Cor Sol corporis, so in the heavens Sol cor cœli: He is tanquam Rex, Dux et Pater, et centrum amoris omnium Planetarum, à quo vires accipiunt. His house is Ω , his exaltation γ , his detriment \cap , his fall \cap . He goes through the Zodiaque in a yeare. Curriculum Titan bis senis mensibus implet.

By him we calculate our Grandfires dates,
The increase of Kingdomes, and decay of States,
By him we measure out to us and ours,

Yeares, Ages, Seasons, Moneths, Dayes, Minutes, Houres.

Sol annum in quatuor partes dispertit: Ver floribus, Æstatem maturis fructibus, Autumnum uvarum collectione, Hyemem tristissimo & immiti frigore depingit et figurat: Nihil est rerum naturalium quod ejus vim non affarim persentiscat.

His \odot with ζ causeth raine, and in Summer (about July the 4 this yeare) thunder with raine; with ζ in aery signes (as January 19) windes and wet, but if ζ be retrograde, great windes, and much wet, (as about 12 Martii) unlesse the aspect

It is probable to cleare the aire: May 13 the Sun is with ♀
 II an aerall signe, ♀ stirring up winde. The 11 of Iuly ☉ is
 with retrograde ♀ in the end of ♄, bringing much winde and
 wet. The last of August the ☉ with ♀ in ♍, causing dry cold
 winde. In the first weeke of November the ☉ meets retrograde
 ♀ in m, causing great winde and much wet: and the ☉ hath
 aspect ♀ to and ♀ but conjunction. The ☉ with the ☽ alte-
 rth the aire to the nature of the season, and in respect of his be-
 ing in the signe, & his configurations & various rising, setting,
 & culminating with the fixed stars; he helpe to produce such
 winde as his partner in dominion is author of: As if h the
 East, ♄ the West, ♃ the North, ♀ the South.

Sero rubens cælum cras indicat esse serenum,

Sed si manè rubet, venturos indicat imbres.

If the Even be red, next morning will be faire:

But if the Moone be red, then showres are neare.

Magnanimo: iustos cr:at hic, & sape superbos

In folio Reges, collocat, atque Duces.

Et sub sole, pulchri et lætâ facie nati. Imperatores, Reges, Princi-
 pes, Duces, Marchiones, Barones, Nobiles, Magistratus, Gentiosi, &
 Domini magnanimi, &c. significat magnanimitatem, honorem, splen-
 dorem, gloriam, &c. Et è contrâ, si sit infortunatus malè dispositus,
 & à planetis malevolis male affectus, &c.

Of Venus ♀.

Venus (inferiorum primus) à venustate: She is the clearest,
 brightest, and most resplendent starre in the firmament; the
 luminaries excepted: She finisheth her course (in a yeare) as
 the Sun, and is not from him in greatest distance about 48 de-
 grees of longitude, by which meanes she is often to be seene in
 the Day time (as to amazement and wonder she did at that time
 our most hopefull Prince Charles was borne, 1630.) but this
 is her annuall passion and habitude to the Sun, though at dif-
 ferent times of the yeare, &c. By reason of her copious light
 she sometimes casteth a shadow: She is the Suns Chamber-
 maid, for when she is the morning star she riseth before him,
 ushering him, and tells us he is not farre of: and when she is
 the evening star, she lights him to bed. The first whereof, she is
 from the 10 of September last yeare, to the 4 of Iuly this yeare:
 Wat

A Prognostication.

But from thence to the 23 of Aprill next yeare she is the later, and shines in the evening very gloriously in the West, she is temperately cold and moist; not retrograde (agreeing with ♀) all this yeare. Her houses be ☿ and ♀, her exaltation ♄, her detriments ♃ and ♁, and the Virgin is her fall. The 12 of January at noone she is with the ☽. February 6 at 3 afternoone with Saturne, but the 11 day at 7 at night she is with the ☽ againe; the 14 of March at 2 in the morne, and the 28 day againe she is with ♀ to be seen before Sun-rise. The 13 of Aprill she is with the ☽ at 5 in the morning; & so the 13 of May & 12 of Iune: But June 25 ♀ and she (if non castè tamen cauet) meet together, which she ☽ opposeth the 27 day, and causeth Apertio Portarum to rain, thunder, lightning, &c. Iuly 4 she is with the ☉, and thence becomes occidentall, and meetes with the ☾ on the 11 day at 11 in the night, and so againe the 10 of August: And the 6 of September she is in league with friendly ♃, with both which the ☽ meetes the 9 day neare spica ♄. October 10 and November 9 ♀ is with the ☽: but the 28 of November ♄ intertaines her, but she hastens from him to meet the ☽ againe the 10 of December: Her coniunction with ♀ raiseth windes and wet weather: with the ☽ in any aspect, but especially by ☿ in the Spring and Harbours clouds and moisture: In winter snow and whirlewinds, and she causeth the South winde, &c.

*Letitiam, choreas, lusus amat, otia querit
Commoda dat thalami fœdera, dotebeat.*

Et sub venere, nepotes nitiduli, musici, lutores, gemmarii, tindores, concubinæ, meretrices, salutatores, pictores, pharmacopæi, homines sanguinei, virgunculæ, &c. si sit bene disposita, de donis, voluptatibus, ornamento, &c. si cadens, de infami libidine, ganeis, scortis, &c. si potens et malè disposita, de stupris, ebrietatibus, dissipandis bonis, &c. cogitat.

Of Mercury ♄.

Mercurius (inferiorum medius) a merce vel mercatura dictus. He is of mutable and changeable nature, He is quasi Orator, or the ☉ Secretary, seldom seen, because his greatest elongation from the ☉ is but 29 degrees: he is swift of motion, yet finisheth his course but as the ☉ and ♀. For his often retrogradations (being this yeare three times) that is, frō the 3 of March

the 25 Day; from the 28 of Iune to the 21 of Iuly: and from
the 22 of October to the 12 of Novemb.) Doe hinder his celerity.
his houses be II and III, his exaltation III, his detriments I &
X, his fall X. Mercury meetes h the 7 of Ianuary at 9 at night,
with the D the 15 Day, with the O the 19 Day. The 16 of Feb.
with the D, March 11 with the O againe; the 15 Day with
the D, and the 28 Day with ♀: Aprill the 12 with the D, the 13
with O, and the 22 with ♀ againe. May 13 with the O, the 14
with the D, and the 21 with ♂. Iune 14 he is with the D. The
15 of Iuly he being retrograde joyneſſe with O and D in the end
of S: and the 16 Day he is with ♂. August the 8 ♂ and he with
the D, and the 31 with the Sun. September the 9 he is with
the D and ♀: And ♀ and he together upon Holy roode Day
cause Apertio Portarum in ventos furibundos, &c. October 9 he
is with D againe: and November the 6 he with the O make a
wet and rainy new Moone. December the 4 he is with the Moone
againe. Thus.

Mercurius fertur brevibus levis athere gyris,

Inconstans, varius, nec statione manens.

Mercator bonus est; varias largitur & artes,

Applicat ille bonis, applicat ille malis.

He is Ventorum Pater, quia eosdem abditâ suâ naturâ suscitât, &
in aquaticis signis, (maximè cum retrogradus est, et sub Solis radiis
arens,) Pluvias repentinas cum magnis flatibus: In aëreis autem
signis facit tonitrua et fulgura, &c.

Et sub Mercurio varium Germen, Negotiatores, Scribæ, Poëtæ,
Arithmeticæ, Philosophi, Monetarii, Mercatores, Bibliopolæ, Typo-
graphi, Sculptores, &c. Benè locatus de Artificiis subtilibus, scientia,
& doctrina, &c. Malè de furto cauto, deceptione; et mendaciis, &c.
fit potens et infœlix de accusationibus, venenis, maledicendis, &c.
cogitar.

Of the Moone D.

Una (omnium infimus) so called, quia alienâ luce luceat; she go-
eth her course every 27 dayes, 7 houres, 44 minutes. D; as
the verse,

Omni mense polum Phœbe nocturna pererrat.

Her light is sweake and mutatiuous, eclipsed sometimes by
interposition of the earth betwene her & the ☉: and sometimes
the

A Prognostication.

She deprives us of the ☉ light, by interposing her opaque body between the ☉ and us; she is of a phlegmatick nature, governing all moist bodies, as is palpable in the fluxe and reflux of Seas, &c. in Shells, &c. She is of the colour of silver, *illa argenteo, ut et ☉ auro præest*. Yet by accident she represents diverse colours not in her superficies, but in the aire about her, as the verse hath it thus signified.

Pallida Luna Pluit, rubicunda flat, alba serenat:

If the Moone smile the fourth day 'twill be faire,

But if she blush, we shall have blustering aire:

And if her browes be muffled with a frowne,

Most of that moneth shall sad teares trickle downe.

The Moone is the earths planet next to it, and immediately posseth on it the lively influence of the heavenly bodies, she is among the planets, *Tanquam Regina mater et nutrix*.

Et Luna dat albos filios, significat quoque reginas, Domicillas seu Matronas Dominantes, Nautas, Piscatores, Institores, Molitores, Venatores, Nuntios, Aurigas, Tabellarios, &c.

Thus in some measure have you learnt the natures, &c. of the 7 Planets and their effects, &c. Now if what is collected be as patiently read, and truly understood, as I have painfully wrote it, and honestly meant it, I shall (God willing, continuing) thinke my labours well bestowed, and none have cause to complaine, but those that understand me not: For I have written aswell to ease those (the more learned) that can and wil not, as to instruct those (the unlearned) that would, but cannot wade through these sciences: Therefore let him againe have a favourable Aspect from the, that wisheth thine, and his Countreys welfare. That desires thee to remit former faults, and correct present errors.

—*Namque nulla parva injuria certe est,
Si mihi Typographi crimina des vitio.*

And till the next yeare Farewell

Thine J. B.

VIVO Deo sit gloria, paX In terra, &
hominibVs beneVolentia.

Amen.
